300mA Small High Speed Dual LDO Regulator, Built-in Inrush Current Protection

■ GENERAL DESCRIPTION

The XC6421 series is an ultra small CMOS dual LDO regulator, mounting 300mA 2-channel small high speed LDO. The series features high accuracy, high ripple rejection and low dropout voltage. The series is capable of high density board installation by the ultra small package of two low on-resistance regulators. Both output accuracies are $\pm 1\%$ by laser trimming.

Each regulator can be turned off independently to be in stand-by mode by controlling EN pin. In this state, the electric charge at the output capacitor (C_L) is discharged via the internal auto-discharge switch, and as a result the V_{OUT} voltage quickly returns to the V_{SS} level.

The output stabilization capacitor (C_L) is also compatible with low ESR ceramic capacitors. The high level of output stability is maintained even during frequent load fluctuations, due to the excellent transient response performance.

Over current protection circuit and over heat protection circuit are mounted, these circuits start working when output current reaches junction temperature or limit current.

The two regulators are completely isolated so that a cross talk during load fluctuations is minimized.

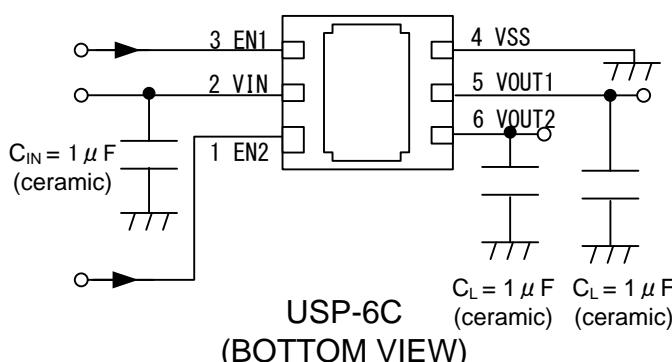

■ APPLICATIONS

- Smart phones / Mobile phones
- Portable game consoles
- Digital audio equipments
- Digital still cameras / Camcorders

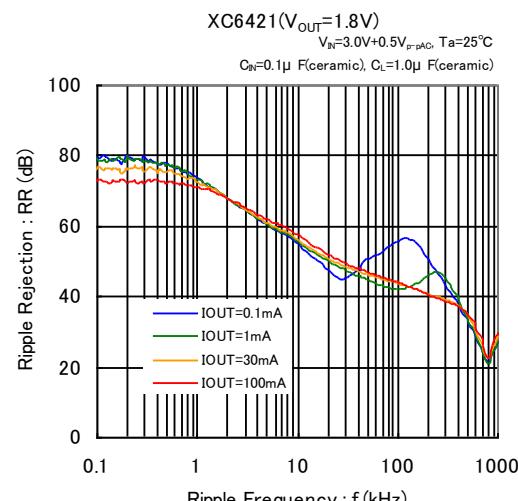

■ FEATURES

Maximum Output Current	: 300mA
Operating Voltage Range	: 1.6V~5.5V
Output Voltages	: 1.2V~3.6V (0.05V increments)
Output Accuracy	: $\pm 1\%$ ($V_{OUT} \geq 2.00V$) $\pm 20mV$ ($V_{OUT} \leq 1.95V$)
Dropout Voltage	: 210mV@ $I_{OUT}=300mA$ ($V_{OUT}=3.0V$)
Low Power Consumption	: 90 μA / ch (TYP.)
Stand-by Current	: 0.1 μA
Ripple Rejection	: 75dB@1kHz
ON/OFF Control	: Active High
Protection	C_L Discharge Current Limit 450mA (TYP.) Short Circuit 125mA (TYP.) Inrush Current Protection Thermal Shutdown
Low ESR Capacitor	: 1.0 μF Ceramic Capacitor
Operating Ambient Temperature	: -40°C ~ +85°C
Package	: USP-6C
Environmentally Friendly	: EU RoHS Compliant, Pb Free

*For other output voltage combinations, please contact your local Torex sales office or representative.

■ PIN CONFIGURATION

USP-6C
(BOTTOM VIEW)

* The dissipation pad for the USP-6C package should be solder-plated in recommended mount pattern and metal masking to enhance mounting strength and heat release. If the pad needs to be connected to other pins, it should be connected to the V_{ss} (No. 4) pin.

■ PIN ASSIGNMENT

PIN NUMBER	PIN NAME	FUNCTIONS
USP-6C		
1	EN2	ON/OFF Control 2
2	V _{IN}	Power Input
3	EN1	ON/OFF Control 1
4	V _{ss}	Ground
5	V _{OUT1}	Output 1
6	V _{OUT2}	Output 2

■ FUNCTION CHART

XC6421 Series, AB Type

PIN NAME	SIGNAL	STATUS
EN	L	Stand-by
	H	Active
	OPEN	Stand-by*

H=High Level , L=Low Level

* When the EN pin is left open, an internal pull-down resistor maintains the EN pin voltage to be low.

■ TEST CIRCUITS

● Circuit ②

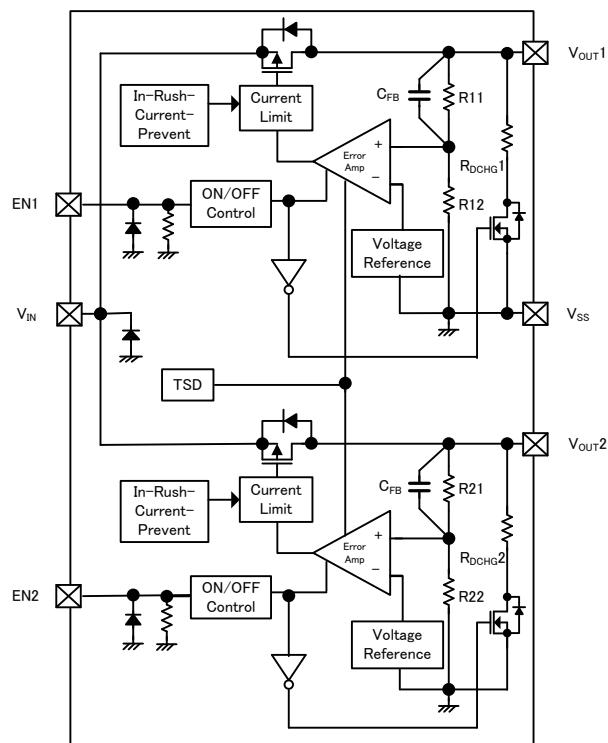

● Circuit ③

■ OPERATIONAL EXPLANATION

The voltage divided by resistors Rx1 & Rx2 is compared with the internal reference voltage by the error amplifier. The P-channel MOSFET which is connected to the Output pin (V_{OUT}) is then driven by the subsequent control signal. The output voltage at the Output pin (V_{OUT}) is controlled and stabilized by a system of negative feedback. The current limit circuit, short circuit protection and thermal protection operate in relation to the level of output current and heat dissipation. Further, the IC's internal circuitry can be shutdown via the EN pin signal.

XC6421ABxxxxseries

<Low ESR Capacitor>

The XC6421 series needs an output capacitor (C_L) for phase compensation. In order to ensure the stable phase compensation, please place an output capacitor (C_L) of $1.0 \mu F$ or bigger at the V_{OUT} pin and V_{SS} pin as close as possible. For a stable power input, please connect an input capacitor (C_{IN}) of $1.0 \mu F$ between V_{IN} pin and V_{SS} pin.

<Current Limiter, Short-Circuit Protection>

The XC6421 series has current limiter and droop shape of fold-back circuit. When the load current reaches the current limit, the droop current limiter circuit operates and the output voltage drops. When the output voltage dropped, the fold-back circuit operates and the output current goes to decrease. The output current finally falls at the level of 125mA when the output pin is short-circuited.

<EN Pin>

The IC's internal circuitry can be shutdown via the signal from the EN pin. In shutdown mode, the XC6421 series enables the electric charge at the output capacitor (C_L) to be discharged via the internal auto-discharge switch, and as a result the output pin (V_{OUT}) quickly returns to the ground pin (V_{SS}) level.

On the other hand, the XC6421 series has a pull-down resistor at the EN pin inside, so that the EN pin input current flows. If this EN pin voltage is set with the specified voltage range, the logic is fixed and the IC will operate normally. However, the supply current may increase as a result of shoot-through current in the IC's internal circuitry when a medium voltage is input to the EN pin.

■OPERATIONAL EXPLANATION (Continued)

<C_L Auto-Discharge Function>

XC6421 series can quickly discharge the electric charge at the output capacitor (C_L), when a low signal is inputted to the EN pin, which enables a part of the IC circuit put into OFF state, via the N-channel transistor located between the V_{out} pin and the V_{ss} pin (cf. BLOCK DIAGRAM). The C_L discharge resistance is set to 230Ω when V_{IN} is 5.5V (TYP.) and V_{out} is 2.0V (TYP.). Moreover, discharge time of the output capacitor (C_L) is set by the C_L auto-discharge resistance and the output capacitance (C_L). By setting time constant of a C_L auto-discharge resistance [R_{DCHG}] and an output capacitance (C_L) as τ ($\tau = C_L \times R_{DCHG}$), the output voltage after discharge via the N channel transistor is calculated by the following formulas.

$$V = V_{OUT(E)} \times e^{-t/\tau}, \quad \text{or} \quad t = \tau \ln(V_{OUT(E)} / V)$$

V : Output voltage after discharge

V_{OUT(E)} : Output voltage

t: Discharge time,

τ : R_{DCHG} × C_L

C_L:Output capacitance

R_{DCHG}:C_L auto-discharge resistance

<Thermal Shutdown>

When the junction temperature of the built-in driver transistor reaches the temperature limit, the thermal shutdown circuit operates and the driver transistor will be set to OFF. The IC resumes its operation when the thermal shutdown function is released and the IC's operation is automatically restored because the junction temperature drops to the level of the thermal shutdown release voltage.

<Inrush Current Protection>

The inrush current protection circuit is built in the XC6421 series.

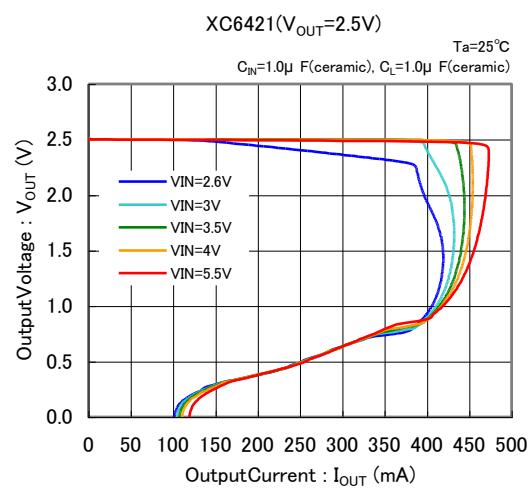

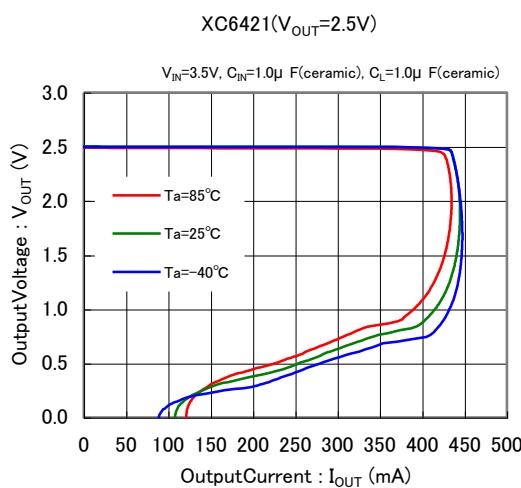

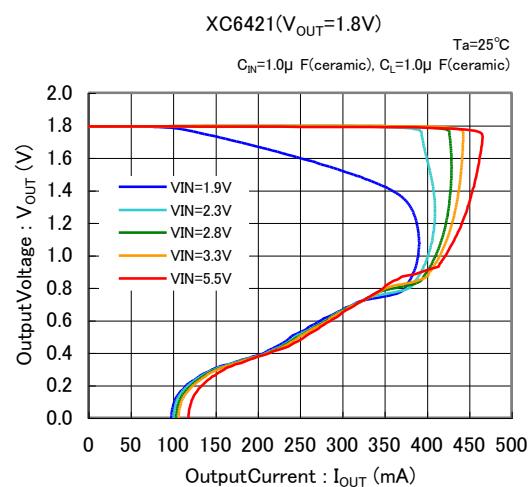

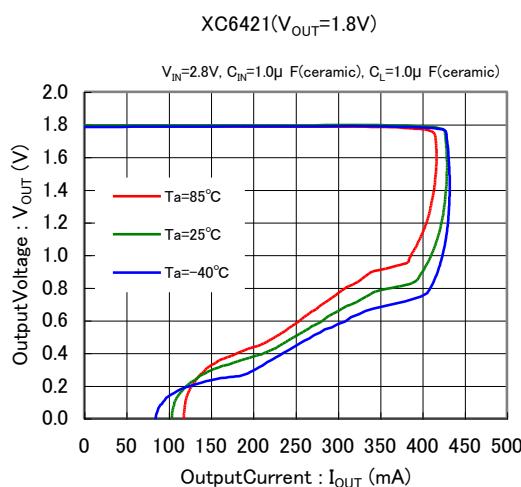

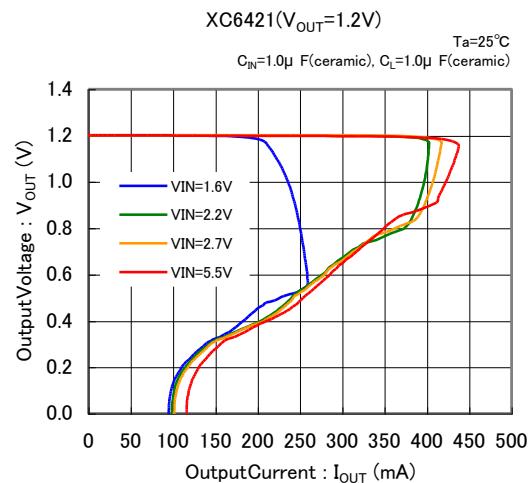

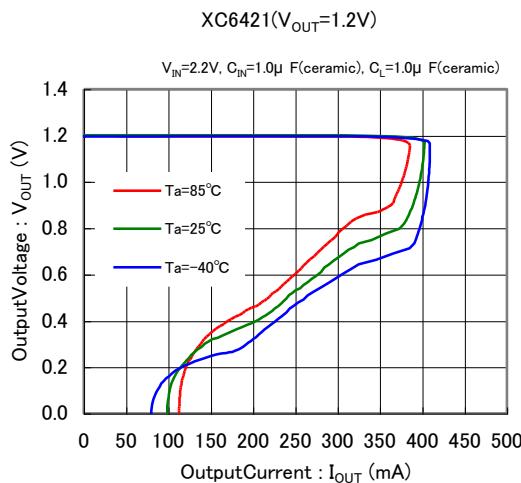

When the IC starts to operate, the protection circuit limits the inrush current as 150mA (TYP.) from input pin (V_{IN}) to output pin (V_{out}) for charging C_L capacitor.

■NOTES ON USE

1. For temporary, transitional voltage drop or voltage rising phenomenon, the IC is liable to malfunction should the ratings be exceeded.
2. Where wiring impedance is high, operations may become unstable due to the noise and/or phase lag depending on output current. Please strengthen V_{IN} and V_{SS} wiring in particular.
3. Please wire the input capacitor (C_{IN}) and the output capacitor (C_L) as close to the IC as possible.
4. Torex places an importance on improving our products and its reliability. However, by any possibility, we would request user fail-safe design and post-aging treatment on system or equipment.
